

### 13.1. Stirrups:

ref: 6.9.08

The unique flexible design of the Royal Rider Flex provides the advantages of shock absorption for joint relief throughout the rider's back and legs.

The wider foot base reduces ankle and leg fatigue.

Ultra lightweight stirrups are a good choice when the saddle themselves are so lightweight.

Constructed from highest grade polymer composite which is extremely tough and hardwearing.

Interchangeable black rubber or stainless steel "cheese grater" foot pads.

Angled tread encourages stirrup to stay with the rider's foot through changing positions and forces, giving unequalled security.

*Available in black, one size.  
Weigh only 10 oz., (280 grams)  
Have a tensile load weight well in excess of 500  
kg/sq.cm*

Care: wipe clean with a damp cloth or rinse in water. Tread can be unscrewed and removed periodically for thorough cleaning.

### 13.2. Stirrup leathers

All Solution saddles incorporate a unique swivel stirrup bar which can be raised to allow the stirrup leather to be slipped easily on and off the stirrup bar. As with traditional saddles, the bar is open-ended to allow the stirrup leather to be pulled off in the event of a rider fall.

*Bates Webbers - Dressage Straps:*

Revolutionary stirrup straps, made without buckles to reduce the lump under the rider's thigh and provide closer contact to the horse. The single thickness under the rider's leg removes excess bulk and interference. Webbing core ensures that leathers do not stretch and cause unevenness, and that holes do not split and tear. Exceptionally strong with a soft hide covering to give a luxury finish. The side covered in soft hide can be placed next to the saddle flap helping to avoid scuffing.

### Solution Jumping Leathers:

Elegant, high quality leathers, covered in luxurious soft hide.

The revolutionary design:

Reduces the thickness of the leather under the rider's leg with a low profile buckle.

Riveted stainless steel attachment is safer than stitched buckle.

The webbing core ensures that the leathers will not stretch and cause unevenness.

Because both these designs are virtually unbreakable, care should be taken to ensure that the stirrup is never allowed to catch on anything otherwise the saddle could be damaged. Always run the stirrups up, cross them over the saddle or use a saddle cover when not in use. When riding, be vigilant and careful going through gateways to avoid trapping the stirrup on latches, posts or other obtrusions.
