

Section 5: Girthing

5.1. Girths:

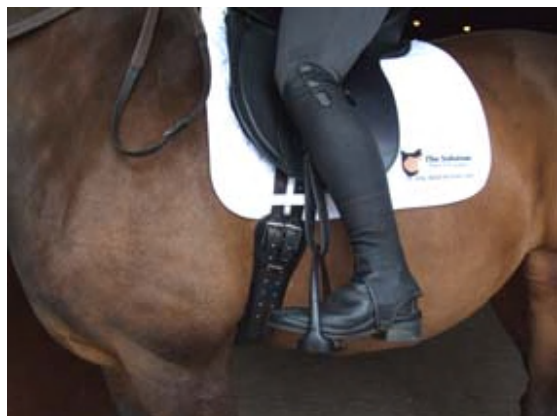

Wintec Chafeless: The only girth that is recommended for use with *The Solution* saddles.

The soft grip of the synthetic non-absorbent material holds the horse's skin and moves with it, preventing friction and rubs.

Curved shape, which reduces the width of material behind the horse's elbows helping to prevent pinching of the horse's skin.

The short, very strong elastic insert in the centre ensures an even give throughout the length of the girth and contributes to the even flexion around the entire barrel of the horse. This ensures that whatever the direction of bend through the barrel or reach through the shoulder, the movement is not compromised. The strength of the elastic means that there is only a small amount of give, preventing over-tightening of the girth.

Sizing:

Short (dressage style) girths should lie as close to the bottom of the saddle flap as possible. This increases comfort for the horse, as the buckle does not lie behind the elbow or close to the costochondral (rib) joints; rider comfort is improved by removing the buckle from under the leg, allowing improved contact. Ensuring that the girth is long enough also makes it easier for the rider to reach the buckle for adjustment whilst mounted.

Sizes available: from 22" in 4" increments to 56"
